Health Canada updates its GVP guidelines

GUI-0102: what a robust pharmacovigilance system looks like, from procedures to partners.

WHY IT MATTERS

A robust PV system lets you

- » Monitor the safety and effectiveness of your drugs
- » Notify Health Canada within the required timelines
- » Take reliable, timely action based on the evidence
- » Document everything to show the deliverables were met

01

Written procedures and deviations

Document step-by-step procedures with unique identifiers, review them on a schedule, and train staff before revisions take effect. Investigate deviations and close them with effective CAPA.

02

Audits and change control

Run a risk-based audit programme across every team and vendor in your PV activities. Use change control so every significant change is documented, assessed, approved, and dated.

03

Validation of computerised systems

Validate any system that captures, processes, manages, or archives PV data, based on its criticality. Reassess and re-validate after software upgrades or data migration.

04

Qualified personnel and the QHCP

Train everyone who may receive an ADR, name a person to oversee PV plus an alternate, and involve a qualified healthcare professional in seriousness, causality, signal, and report decisions.

05

Contractual agreements

You can delegate activities, but you stay responsible. Put signed, dated agreements in place that define roles, audit rights, data exchange, and record retention, and review them regularly.
